

Attentional Field Development and Training in Visual Impaired Children 2-6 yrs

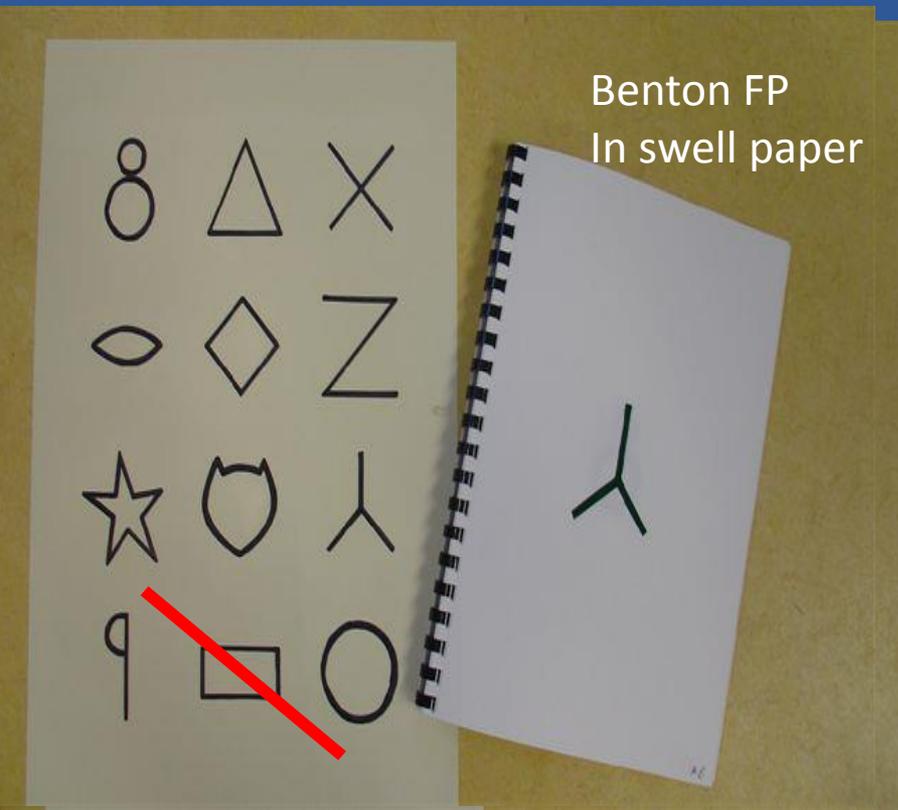

Drs. Marjolein Dik

GZ psychologist / neuropsychologist

Royal Dutch Visio, Amsterdam

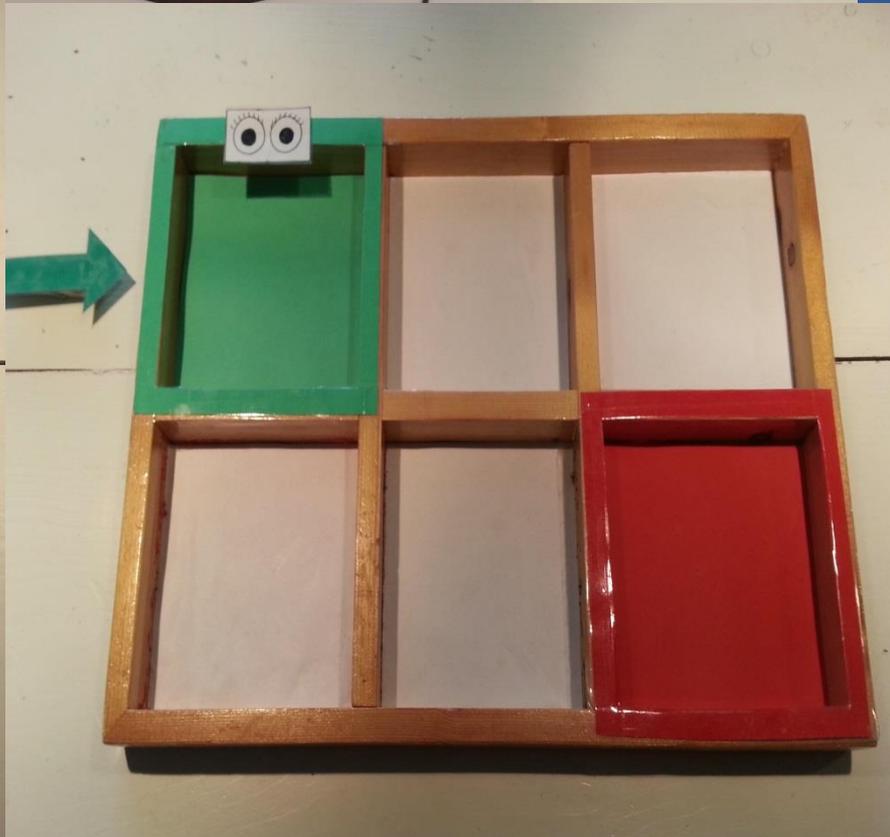

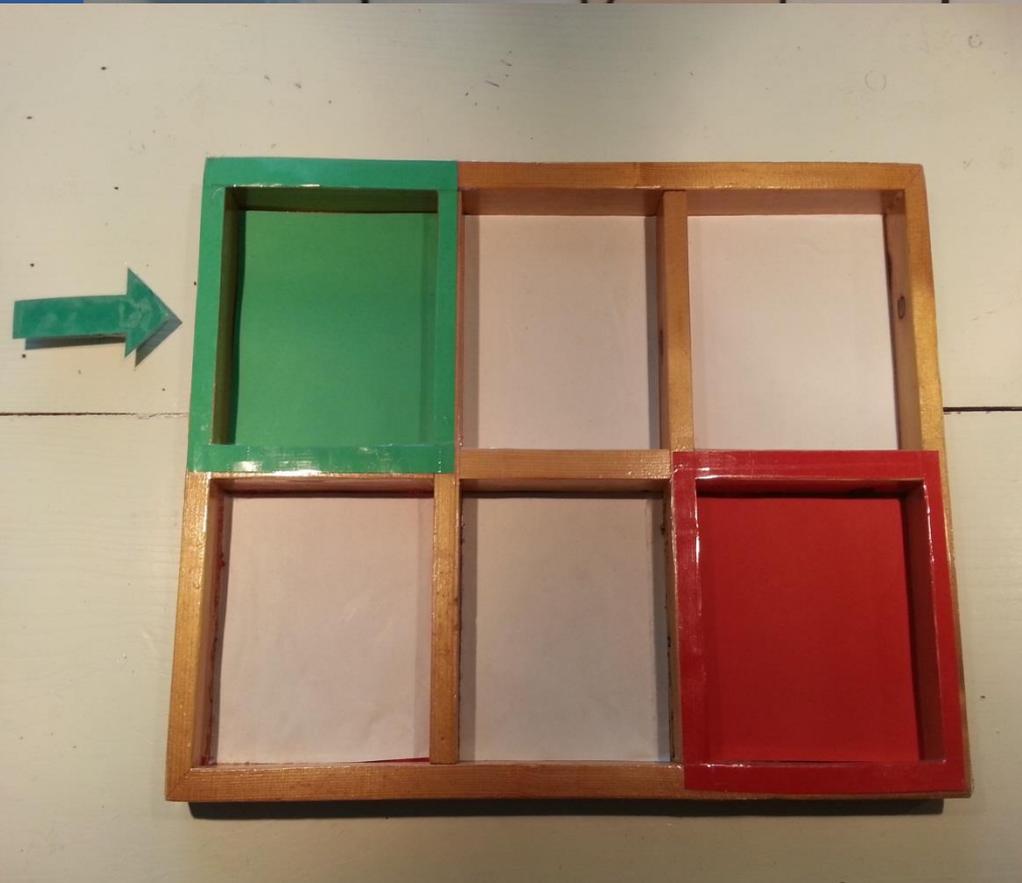

- Increasing knowledge about CVI/CTI 
- Crucial development of executive functioning

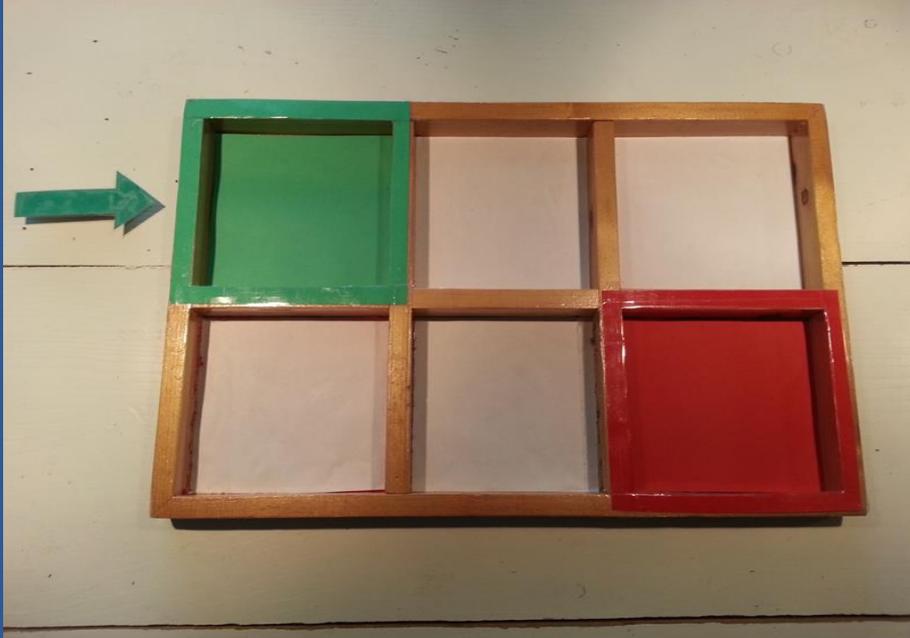

Essential to develop consciousness of attentional field (and other) limitations

Attentional field development training in young VI children

- Program?
- What do we do in this field?
- Why?
- Can we make a program out of it?
- Can we do this together in Europe?
- Please join in collecting!

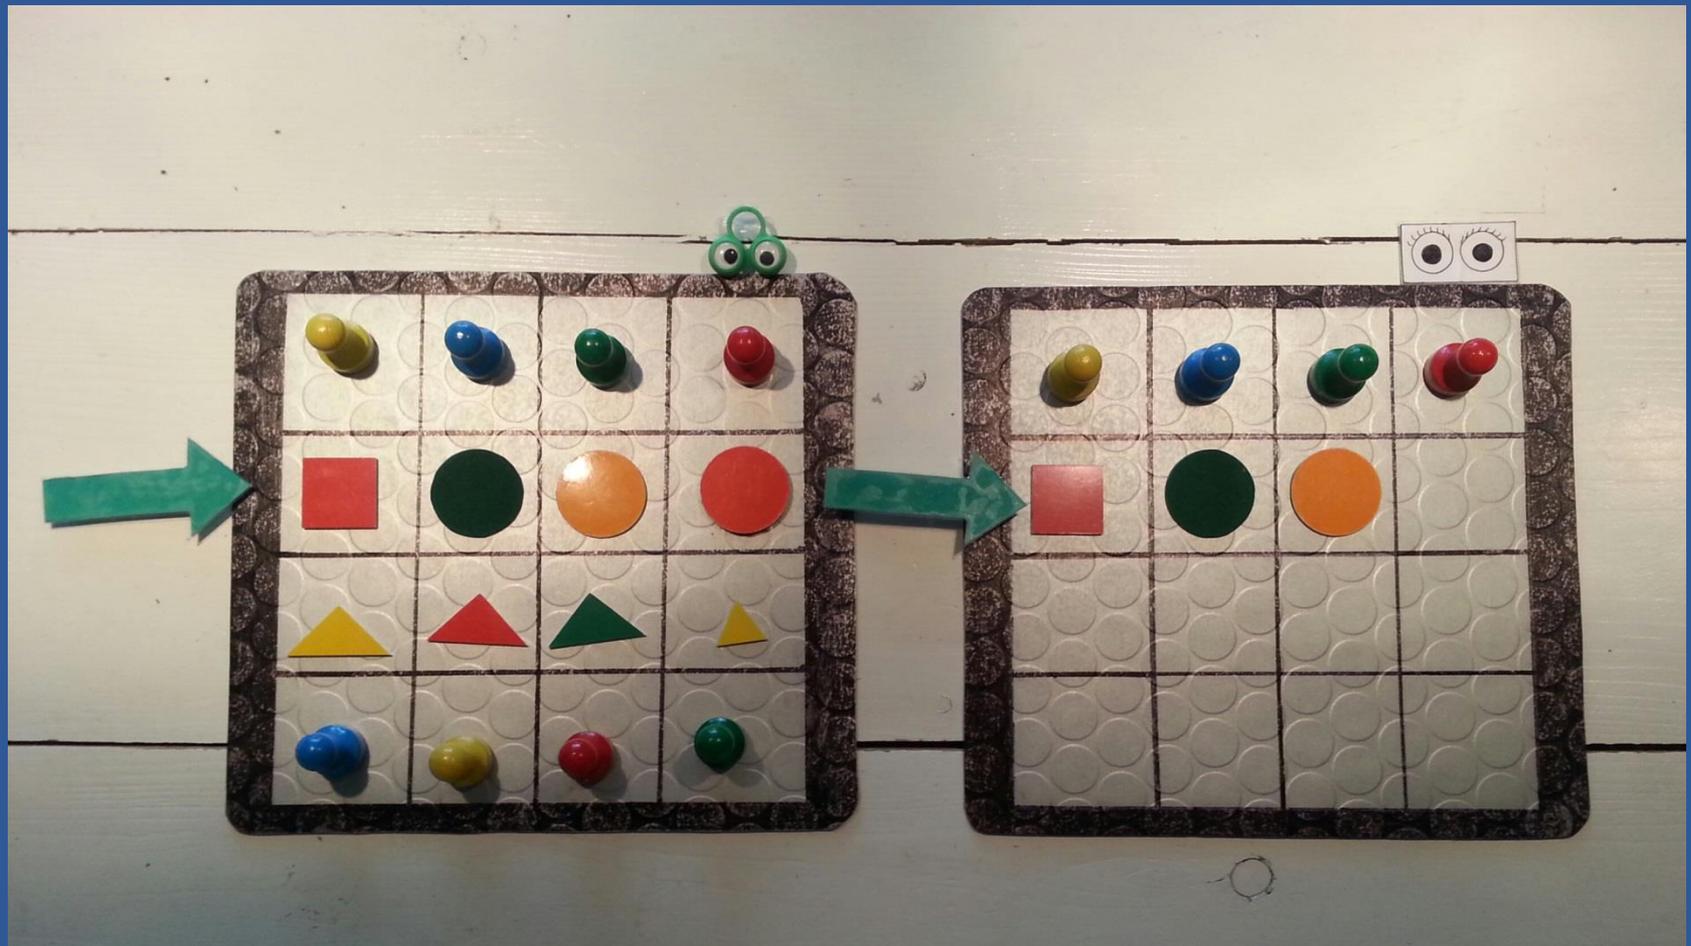

- from little to lots of material per box and search (selective attention / crowding training)
- search in a certain direction (vertical horizontal) in stead of crisscross

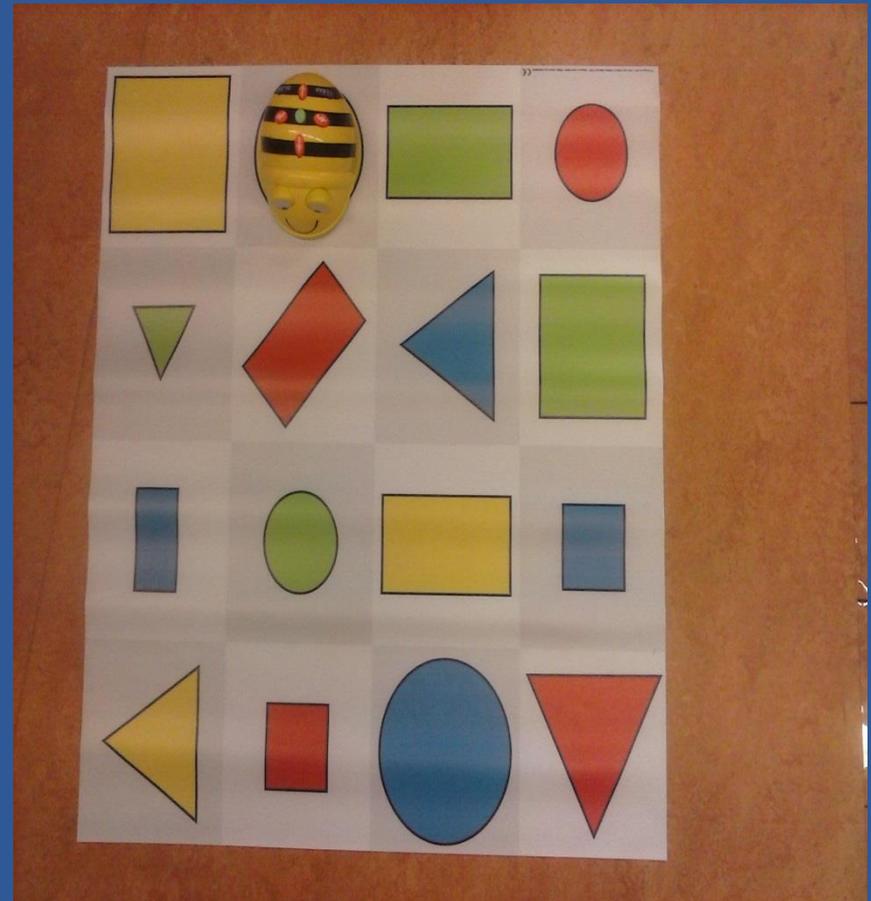

Copy the given the positions

Directing attention with a plan

Outside?

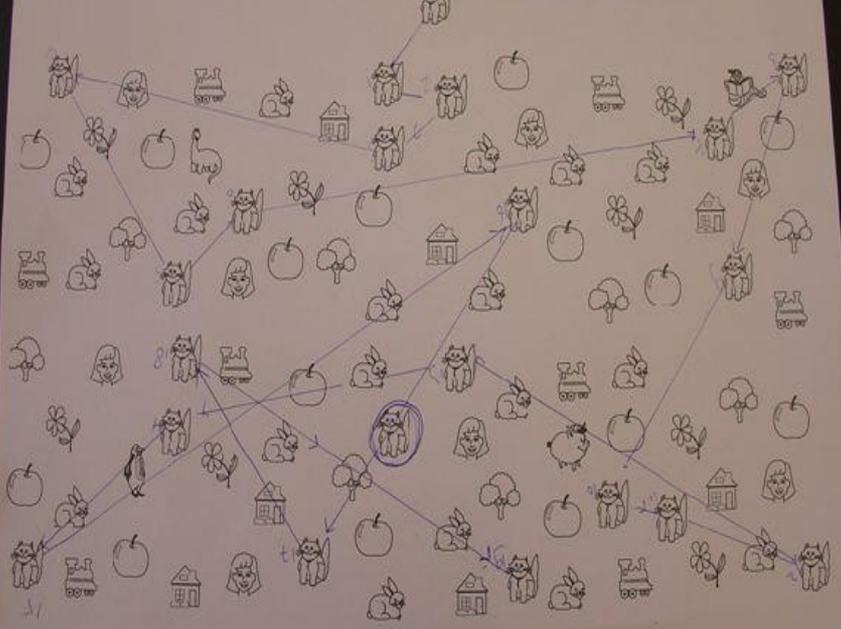

Most activities at a table

Not in free space

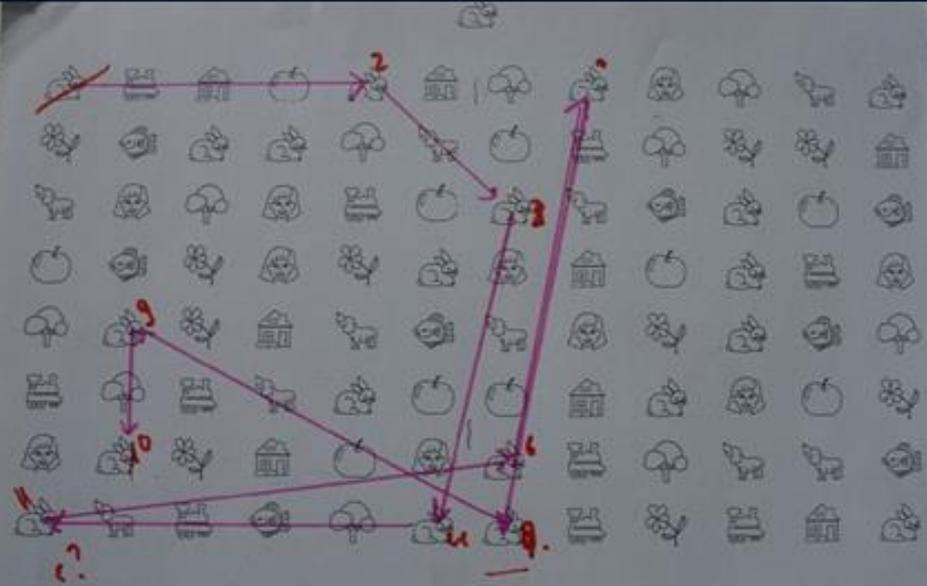

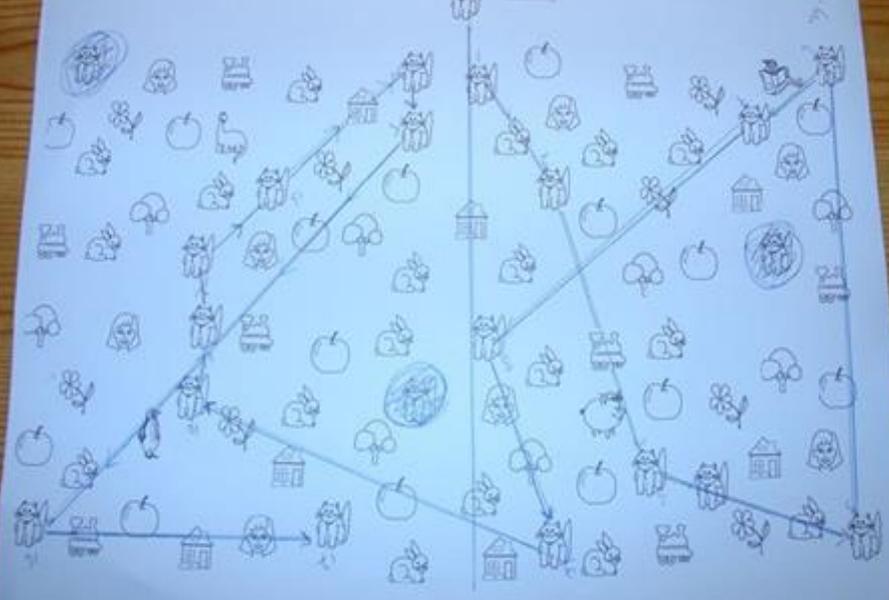

General attentional field development

- Babies – attentional tunnel straight ahead
- Develops into a circle around the body of the toddler
- Into a left and right attentional field (along with the lateralisation development)
- Young children always start at the right side (unless brain...)

Z

N

Room full or play ground??

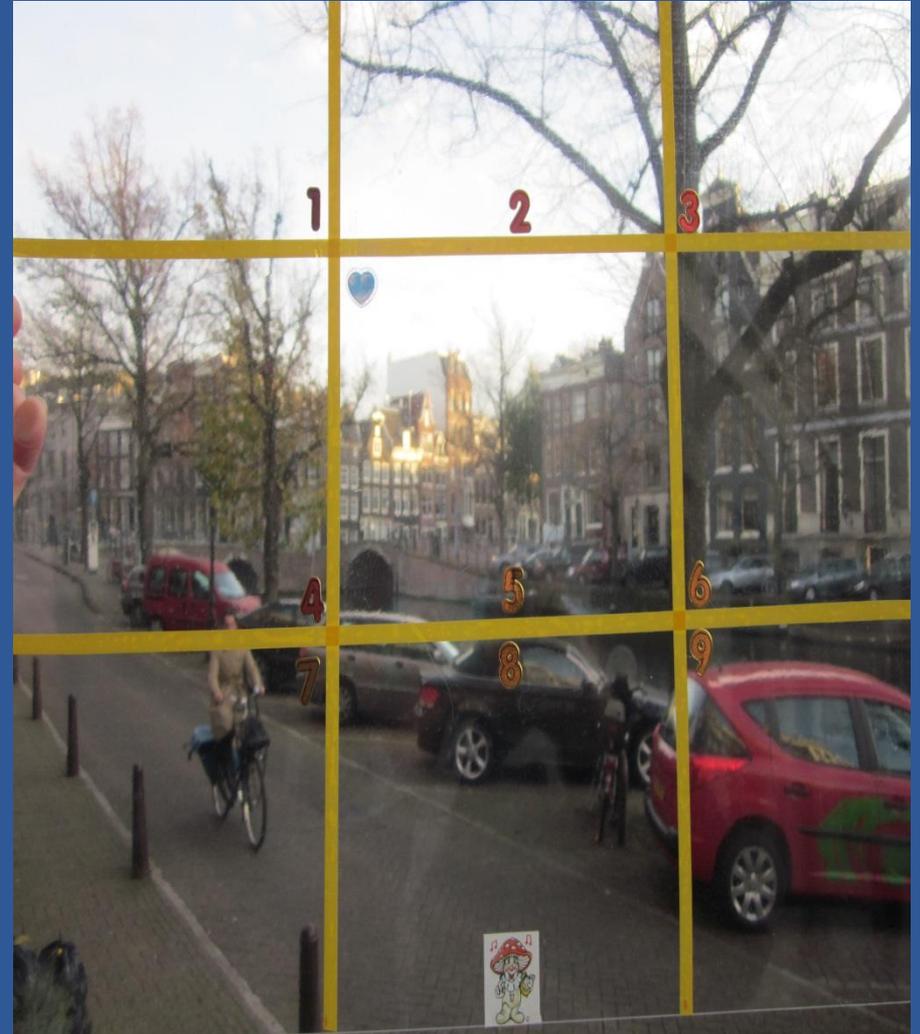

- Sit and talk about it
- Where to expect things???
- Exercises with (traffic) cones or other objects in free space

NB

- For blind children it is less of a problem since echo localization (and other mobility) techniques are more in use

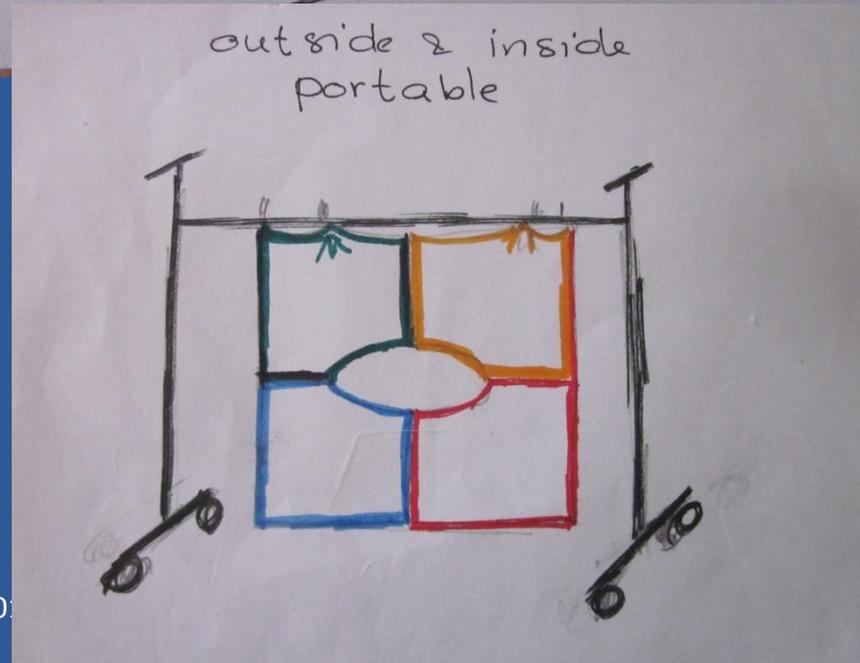

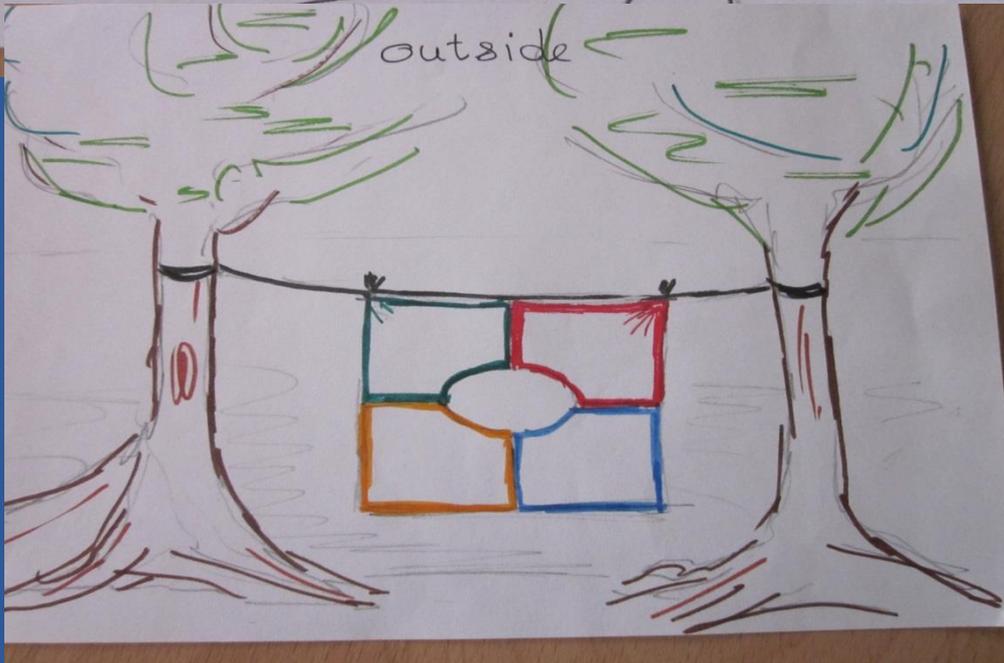

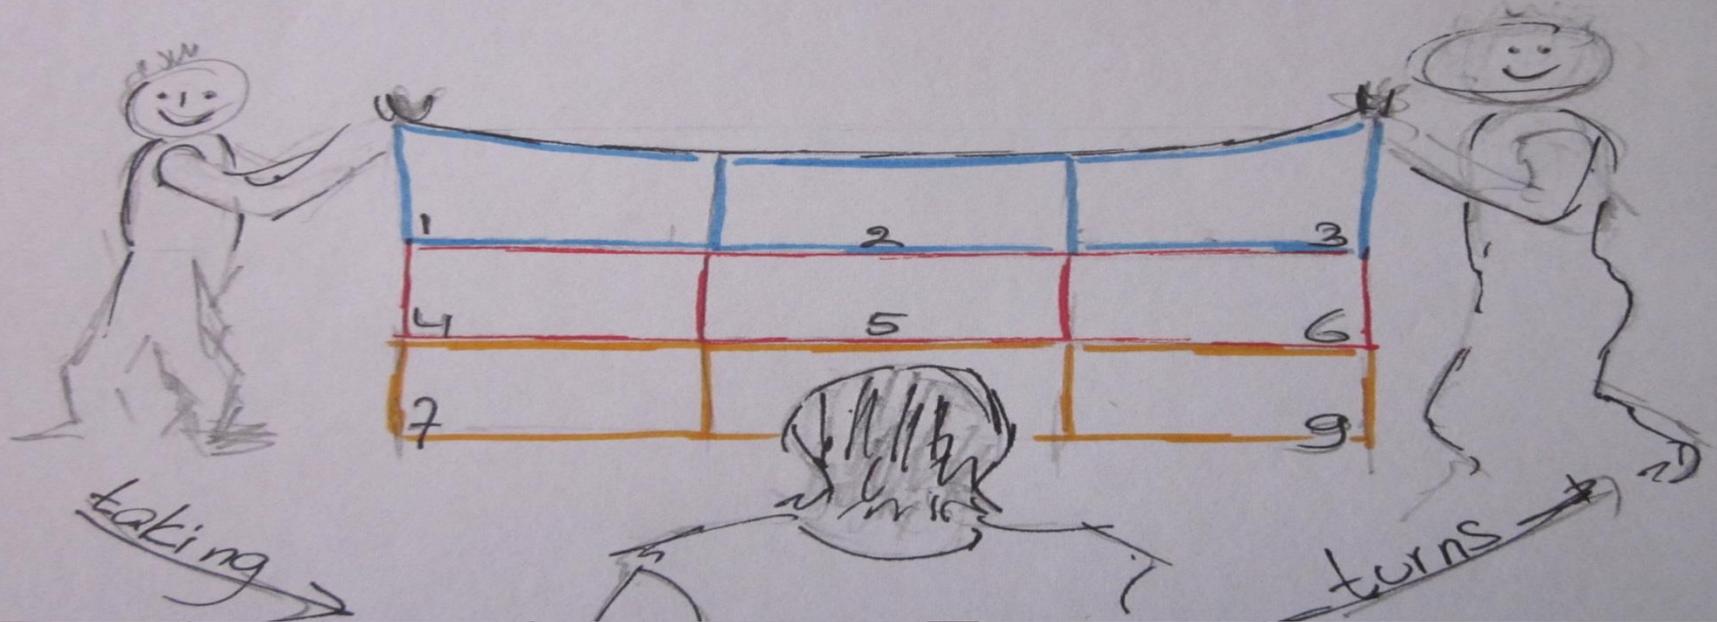

Using torches and headlights

- To support selective attention – showing where to look from a distance
- Why not show search patterns or steps?
- To develop awareness of search patterns using head lights (child and counsellor each)

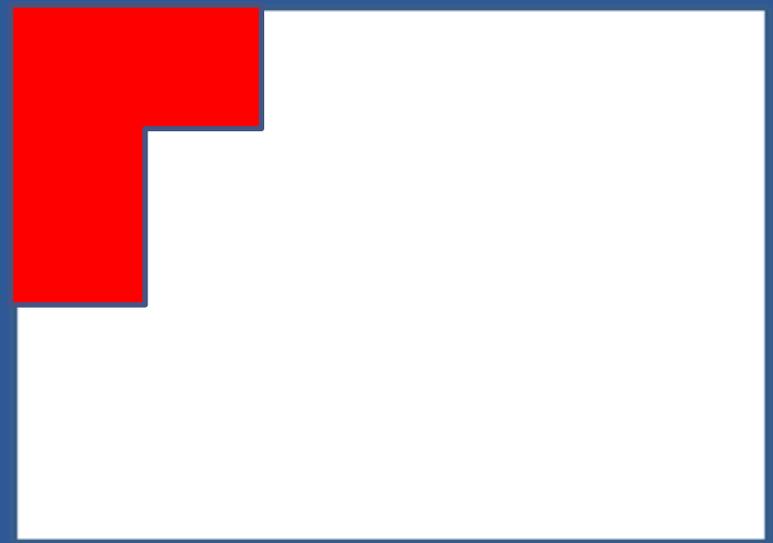

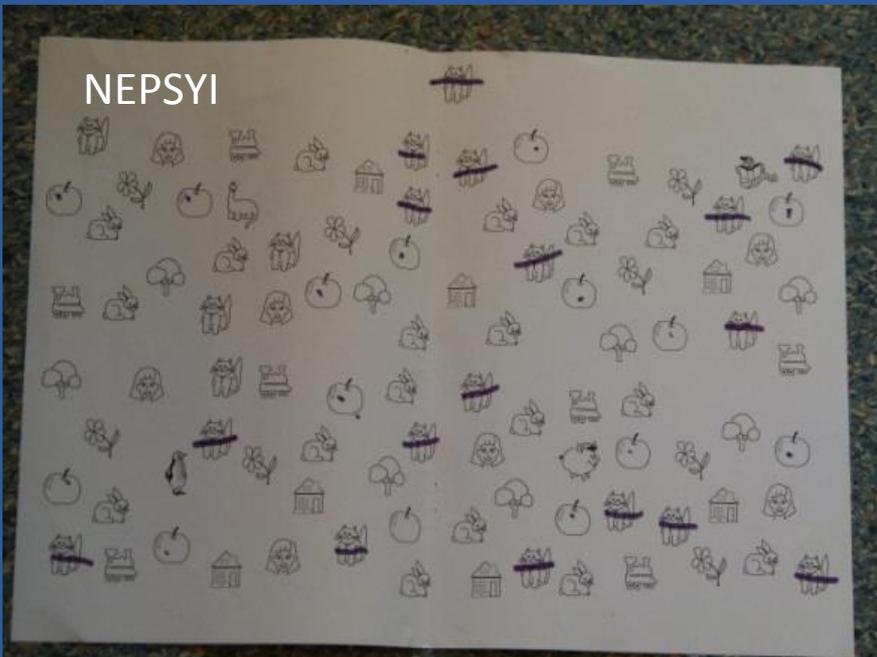

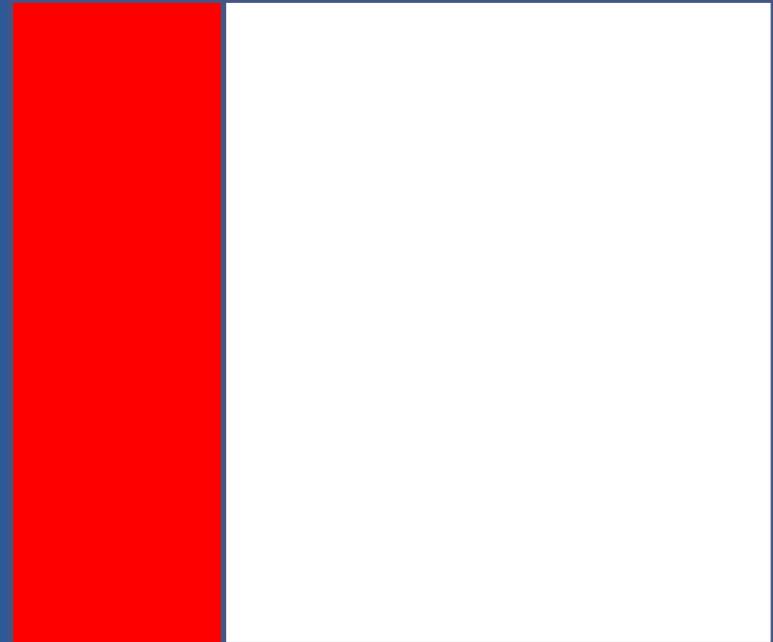

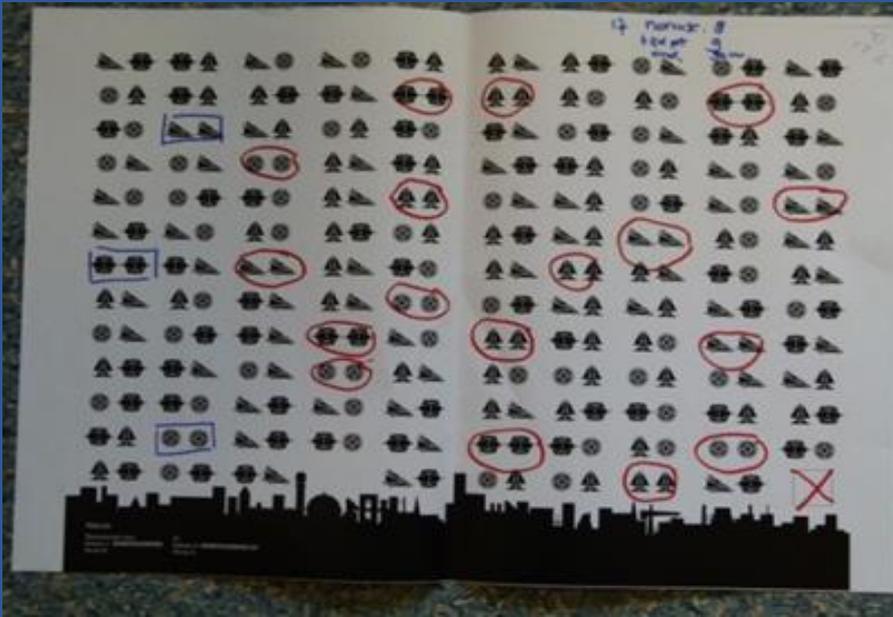

- Boxes must be open (because of acuity, reflections, wind)
- Markers must be transparent (age and child fitting)
- Markers must be logical (airplane, bird \uparrow , bike \downarrow)
- Search strategies go from down \Rightarrow up later up \Rightarrow down; right \Rightarrow left and around 5-6 left \Rightarrow right

playground game

Sub test Space ships Tea-Ch

- Make VI children aware of their own search patterns at an early age and show efficient search patterns much earlier in reality – advanced thinking about looking!
- Please share your excercises and ideas – I'll try and make a program out of it
